

UPDATE FOR VERSION 2

Updates:

- **Code Organization:** The admin class is no longer a god object and now only does what it is able to do as listed in the api. In replacement the server object is now a god object. I thought that this was okay since in reality, the server is supposed to have access to everything.
- **Reports:** The way reports are being handled has been slightly refined. A new set of reports are not being made everytime 'GET /report' is called. It now gets orders that are due the same date as the specified start date and end date other than strictly inbetween. This can still use a little bit more refinement.
